

**Effects of different XBT corrections on historic and recent ocean heat content calculations**  
Tim Boyer

National Oceanic and Atmospheric Administration / National Oceanographic Data Center

The effects of recently published global time varying statistical corrections for XBT depth errors are examined for the period 1967-2010. To ensure that the XBT corrections are the only independent variable upon which the heat content is dependent, the same analysis technique and set of data and quality control are used with each set of corrections.
